

IBM SAN Volume Controller/Storwize
Last update 10/01/2013

Requirements:

For topology & capacity data only, you must provide a service account, which is member of the "Monitor" user group.

In order to collect performance data (IBM SVC dumps) over SSH, the service account must be in the "Administrator" or "SecurityAdmin" user group.

When enabling performance data collection, this will periodically transfer over SSH (scp/sftp) the SVC dumps into the Watch4net collector host. Those files will be purged/deleted from all SVC nodes, after processing. Collecting performance data from multiple Watch4net collector hosts at the same time is not supported.
