

VMware vCenter
Last update 04/05/2013

Requirements:

The collect and the events blocks require a user account to connect on the VMware vCenter server. This is a service account that must be able to access all desired objects from VMware vCenter. We recommend that you create an account on the VMware vCenter server, for the Watch4net collection.

Statistics Level:

VMware vCenter uses Statistics Level "1" by default for all intervals. Based on the level, you will be able to collect more or less data. Watch4net collector only uses the "real-time" interval (5 Minutes).

- Level 1: Default level. All capacity data, Datastores topology, ESX/Virtual Machines basic performance and information will be available.
- Level 2: More reports will be available, including Disks IOPS
- Level 3: More reports will be available, including networking stats.
